The sticking point comes in the High Court, where former National Director of Public Prosecutions (NDPP), Michael McGuigan, is fighting to have a warrant set aside to allow the State to continue searching the premises. The most recent revisions to the code, published in October 2013, also introduce the possibility of appeals for bail applications, and allow the probation and parole service to hold an offender for up to eight days after her release. Critics argue that the prospect of potentially having an innocent person locked up will deter victims from reporting crimes to police. Sinn Fein Senator Joe McHugh said the report had been "misleading and muddled" and did not reflect the vision that supported the 1998 Good Friday Agreement. Mr McGowan left Government in a row over Sinn Fein policy. Mr McGowan was a key ally of Tony Blair and he will be bitterly disappointed to see Labour's stance on welfare reform. It means that working people who come into contact with the welfare system will still be able to use their cards to claim benefits. The controversy was thrown into high gear on Thursday when the Department of Health published a copy of the report on its website. Karen Robinson. At the same time I have tried using xxd to make the obvious double bytes and single bytes (see here). These hexdump commands (one for the xxd command, and one for the hexdump command) produced the following output, which is where my un-entertaining attempts ended. The text box that appears in the file has a style of text in it that appears to be Black. Can anyone advise how to parse this? A: EDIT: this answer completely changes the spirit of the question. The questioner was asking for a hex-editable version of the text so I would like to clarify that in the spirit of this question: I don't know how to edit the file inside the file, I just need to read it. Therefore, you may append an entirely new question about the parsing of the file. The file is a text file with a very weird encoding. I was able to convert it into a simple csv using the (x)zcat. If you zip/tar/gzip the file you can get an tar archive you can extract and read with: gunzip -c | xzcat > file.txt.txt If the file can't be extracted, it's not likely that you can parse it. If you have time, I strongly recommend you dig further into this, since it's a very interesting topic and I doubt that I could decipher the encoding alone in this amount of time. Since my knowledge is lacking on this topic, let me just give a few pointers: If it is a text file, there could be different encodings. The more likely encoding, as there is no similarity in the filenames, is utf-8. If you have a non-english character, it is possible that they used proprietary encodings. Try using some tools to get a list of what the character is. If you find a non-english character that you cannot convert, then perhaps it isn't text at all. If it is a binary file, like a binary image or a binary PDF or a binary mp3, then you may be able to open it, but it is worth noting that you won't be able to parse it at all. On a side note: it's good that you asked about the white-box, since they can get a lot of problems that others can't. In this case, it's often very 50b96ab0b6
